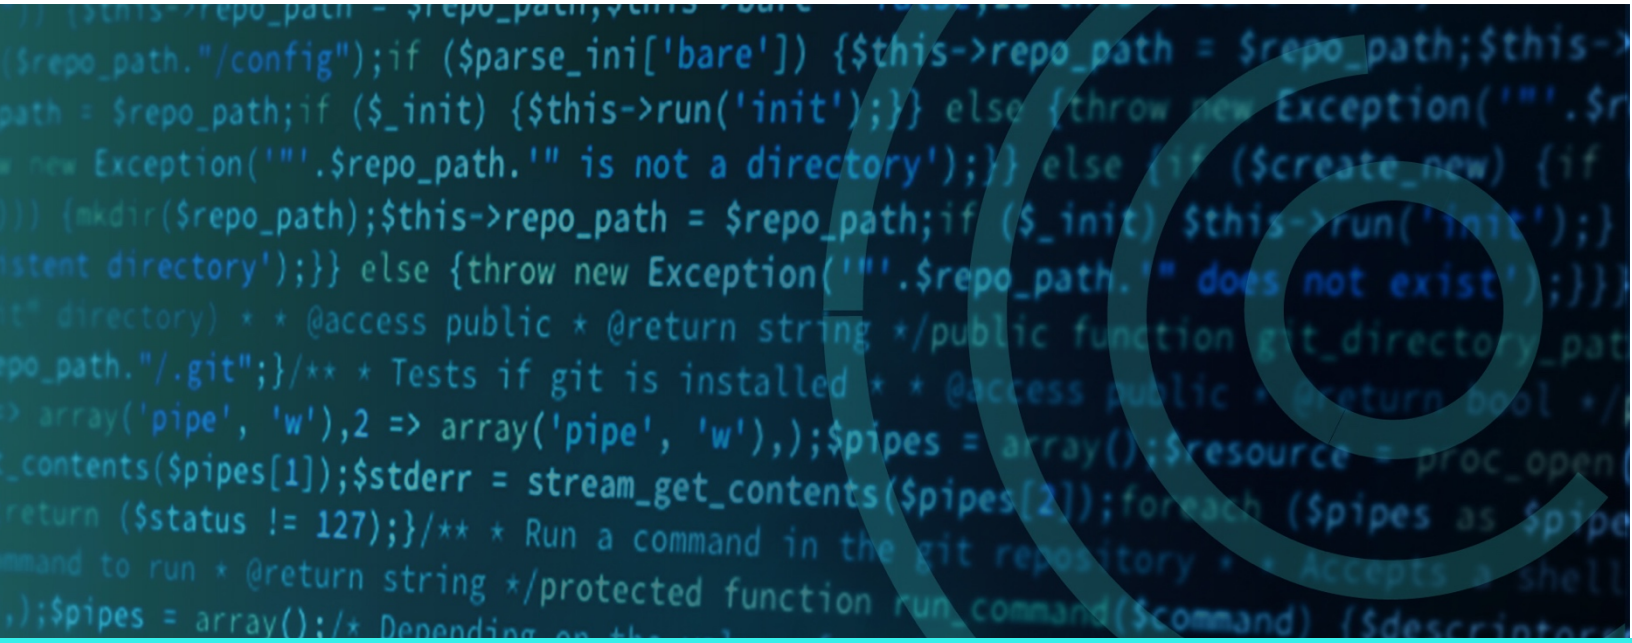
Source Code Development

MScFE 690

Capstone Course



Revised: 4/18/2019

Source Course Development

As you proceed with your Capstone, the coding portion of the project will grow. Additionally, you may be working with your team members on a distributed development project. In order allow smooth collaboration and sharing, please do the following:

- Create a private Git project on BitBucket or GitHub to host your code. Details of how to create the same can be found at the following locations –
  - ✓ **BitBucket**: https://confluence.atlassian.com/bitbucket/create-a-git-repository-759857290.html
  - ✓ **GitHub**: https://help.github.com/en/articles/create-a-repo
- Complete the project with comments, README, Config file, Contributors file etc. Go through Git best practices mentioned at https://gist.github.com/pandeiro/1552496 and try to follow them.
- Include a **requirements.txt** file for Python which would help the instructor to install all requirements packages using a "pip install –r requirements.txt" command. This document should contain any specific instructions on how your program should be executed.
- Provide full access to your group members for collaborative development. Make sure you use proper commit messages during each code commit/push.
- Provide 'Read Only' access to your instructor or any of your peers who will review your work
- Share the HTTPS link to the Git Project with your peers and your instructor who will review it and give feedback and guidance
